

Week 04: CSS Basics (2)

Understanding font-family in CSS

font-family is a CSS property used to specify the typeface for the text on a webpage. It allows you to choose the font that will be applied to the content, making the webpage more readable and visually appealing.

By defining a `font-family`, you ensure that your text will be displayed in a consistent and aesthetically pleasing way across different devices, browsers, and operating systems.

Why use font-family?

- **Consistency:** Ensures the text looks consistent across all browsers and devices, even if the preferred font is not available.
- **Readability:** Choosing the right font can improve the readability of the content, especially for large amounts of text.
- **Design:** Different fonts give a distinct look to your website and can help with branding and user experience.

Font-family Example

```
<style>
  body {
    font-family: 'Times New Roman', Arial, sans-serif;
  }
</style>
```

Creating a Horizontal Navigation Bar

To create a horizontal navigation menu with no bullet points, you can use an unordered list (`ul`) and style it with CSS.

```
<style>
  nav ul { /* it can be ul.nav as well */
    list-style-type: none; /* Remove bullet points */
    padding: 0;
    margin: 0;
    overflow: hidden;
  }

  ul.nav li {
    display: inline; /* Display list items in a horizontal line */
    margin-right: 20px; /* Add some spacing between items */
  }

  ul.nav li a {
    text-decoration: none;
    color: #007BFF;
    font-weight: bold;
  }
</style>

<ul class="nav">
  <li><a href="#home">Home</a></li>
  <li><a href="#services">Services</a></li>
  <li><a href="#contact">Contact</a></li>
</ul>
```

In this example, we create a horizontal navigation bar with no bullet points. The `list-style-type: none` removes the default bullet points, and the `display: inline` property makes the list items appear in a horizontal row.
