

Week 04: CSS Basics (3)

CSS Styling: Text Alignment, Borders, and Font Styling

In CSS, we can use several properties to enhance the appearance of text, borders, and fonts. Let's explore how we can style our elements using the `text-align`, `border`, and `font` properties.

1. Text Alignment

The `text-align` property helps control the alignment of text within a container. Common values include:

left: Aligns text to the left (default).

```
<p style="text-align: left;">This text is aligned to the left.</p>
```

right: Aligns text to the right.

```
<p style="text-align: right;">This text is aligned to the right.</p>
```

center: Centers the text horizontally.

```
<p style="text-align: center;">This text is centered.</p>
```

justify: Stretches the text to fill the width of the container. (cannot be demonstrated with this short line)

```
<p style="text-align: justify;">This text is justified.</p>
```

2. Border Styling

The `border` property allows us to define the width, style, and colour of an element's border. You can use values like `solid`, `dashed`, `dotted`, etc.

For example, creating a solid border:

```
<div style="border: 3px solid #4CAF50;">This div has a green solid border.</div>
```

You can also use other border styles:

```
<div style="border: 2px dashed #FF5733;">This div has an orange dashed border.</div>
```

```
<div style="border: 2px dotted #0000FF;">This div has a blue dotted border.</div>
```

```
<div style="border: 3px double #FF1493;">This div has a pink double border.</div>
```

3. Font Styling and Colouring

You can style fonts in CSS by using properties like `font-family`, `font-size`, `font-weight`, and `color`. These properties help control the type, size, weight, and colour of text.

Here is an example of applying font styling:

```
<p style="font-family: 'Arial', sans-serif; font-size: 18px; font-weight: bold; color: #4CAF50;">
This is a styled text with Arial font and green colour.</p>
```

</p>
